

Your Emotional Connection to Lean

Lean professionals are uniquely committed to Lean management due to a strong emotional connection.*

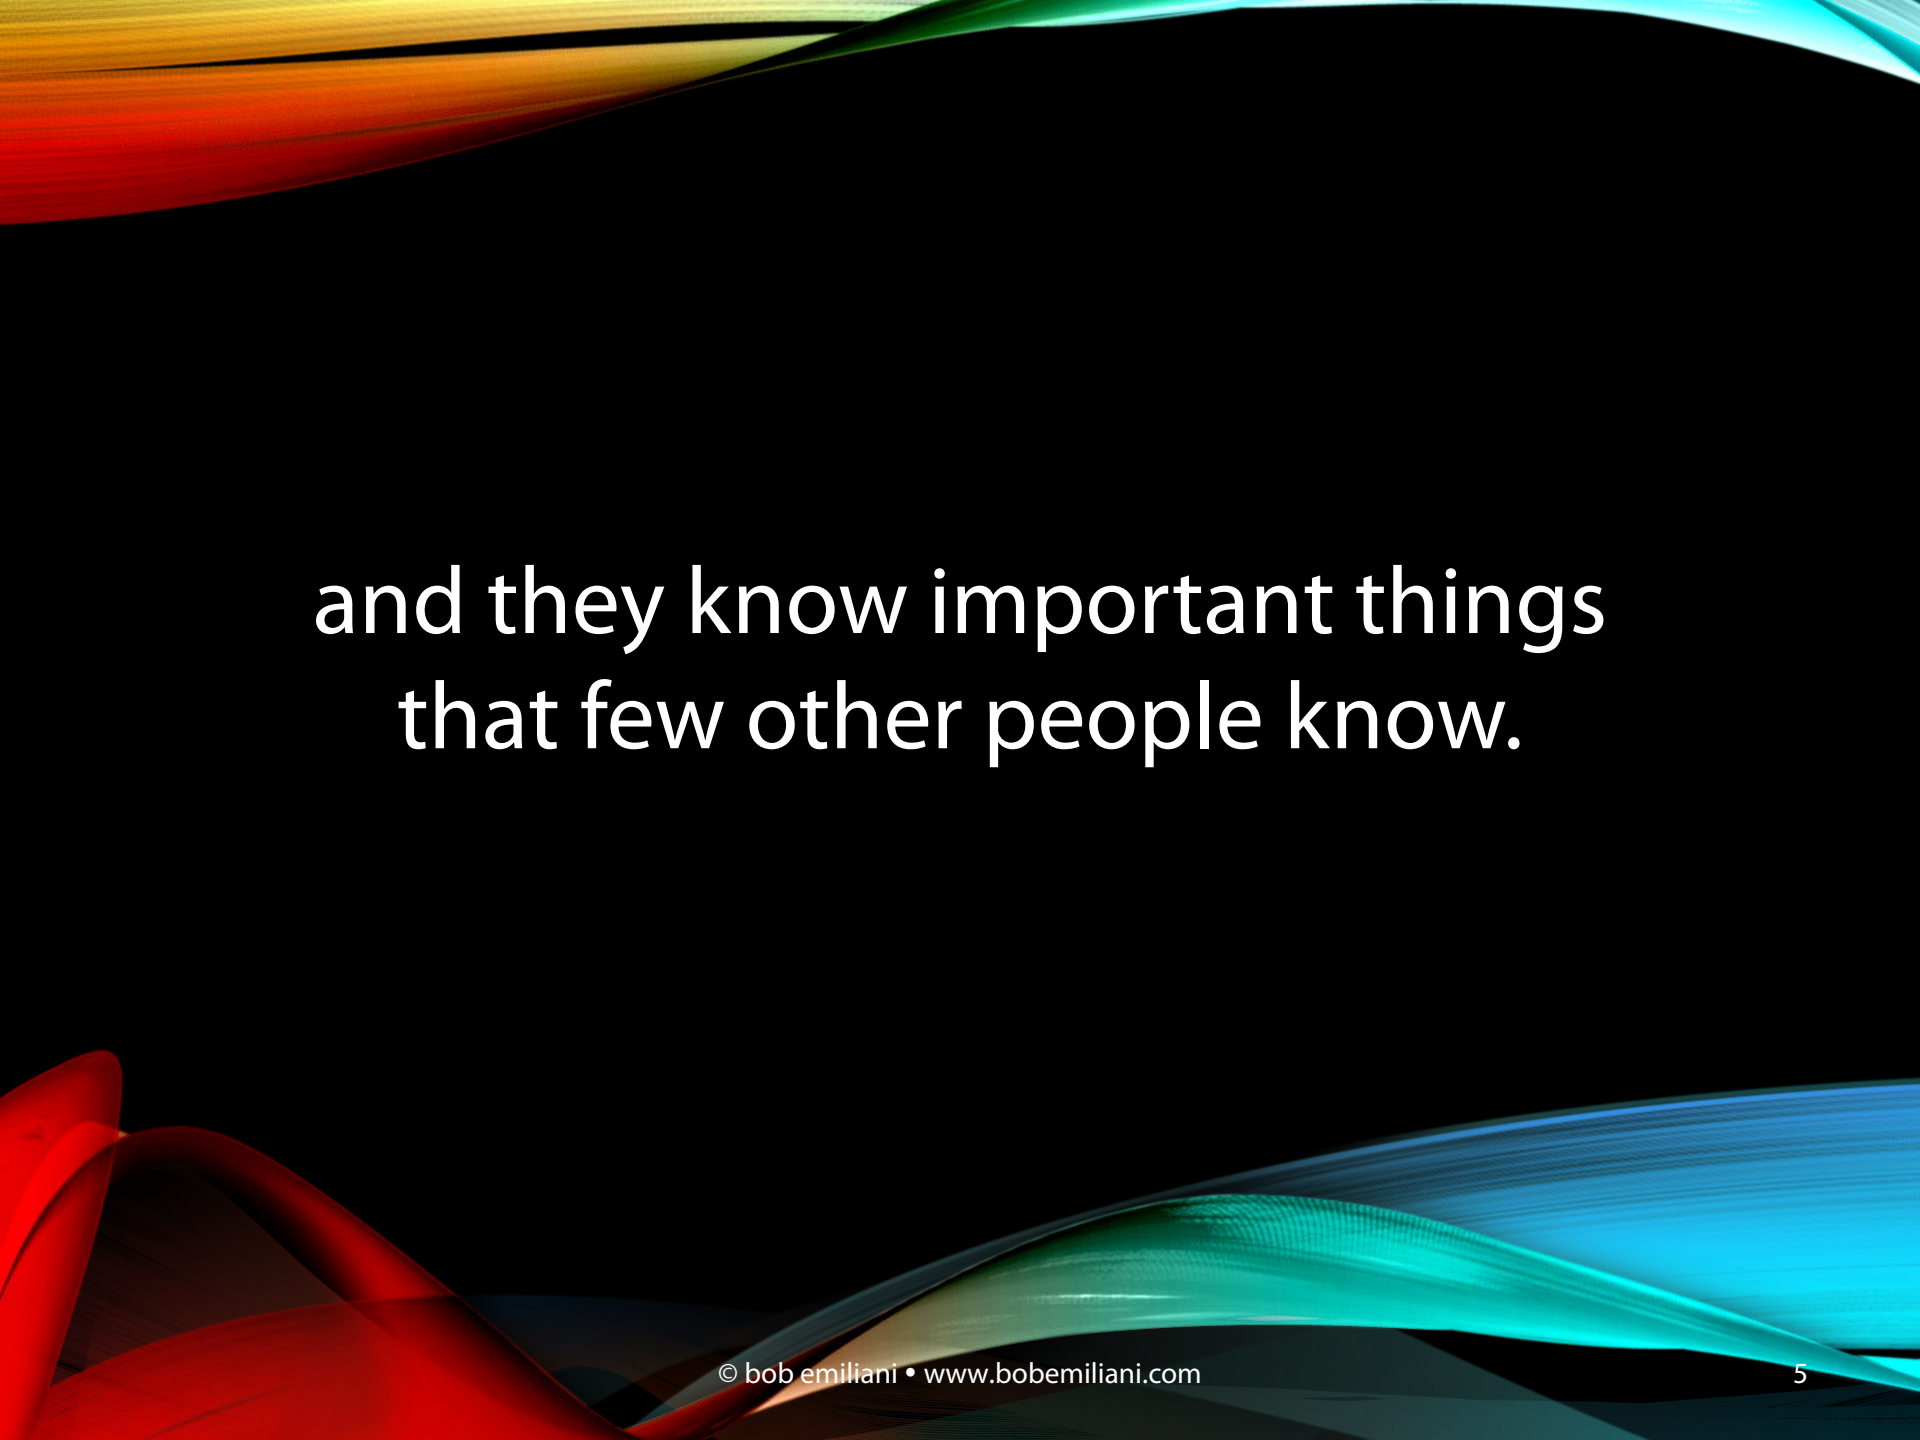

* The same is true for Agile and Scrum people.

Why?

They love the myriad wonderful possibilities that Lean presents...

and they know important things
that few other people know.

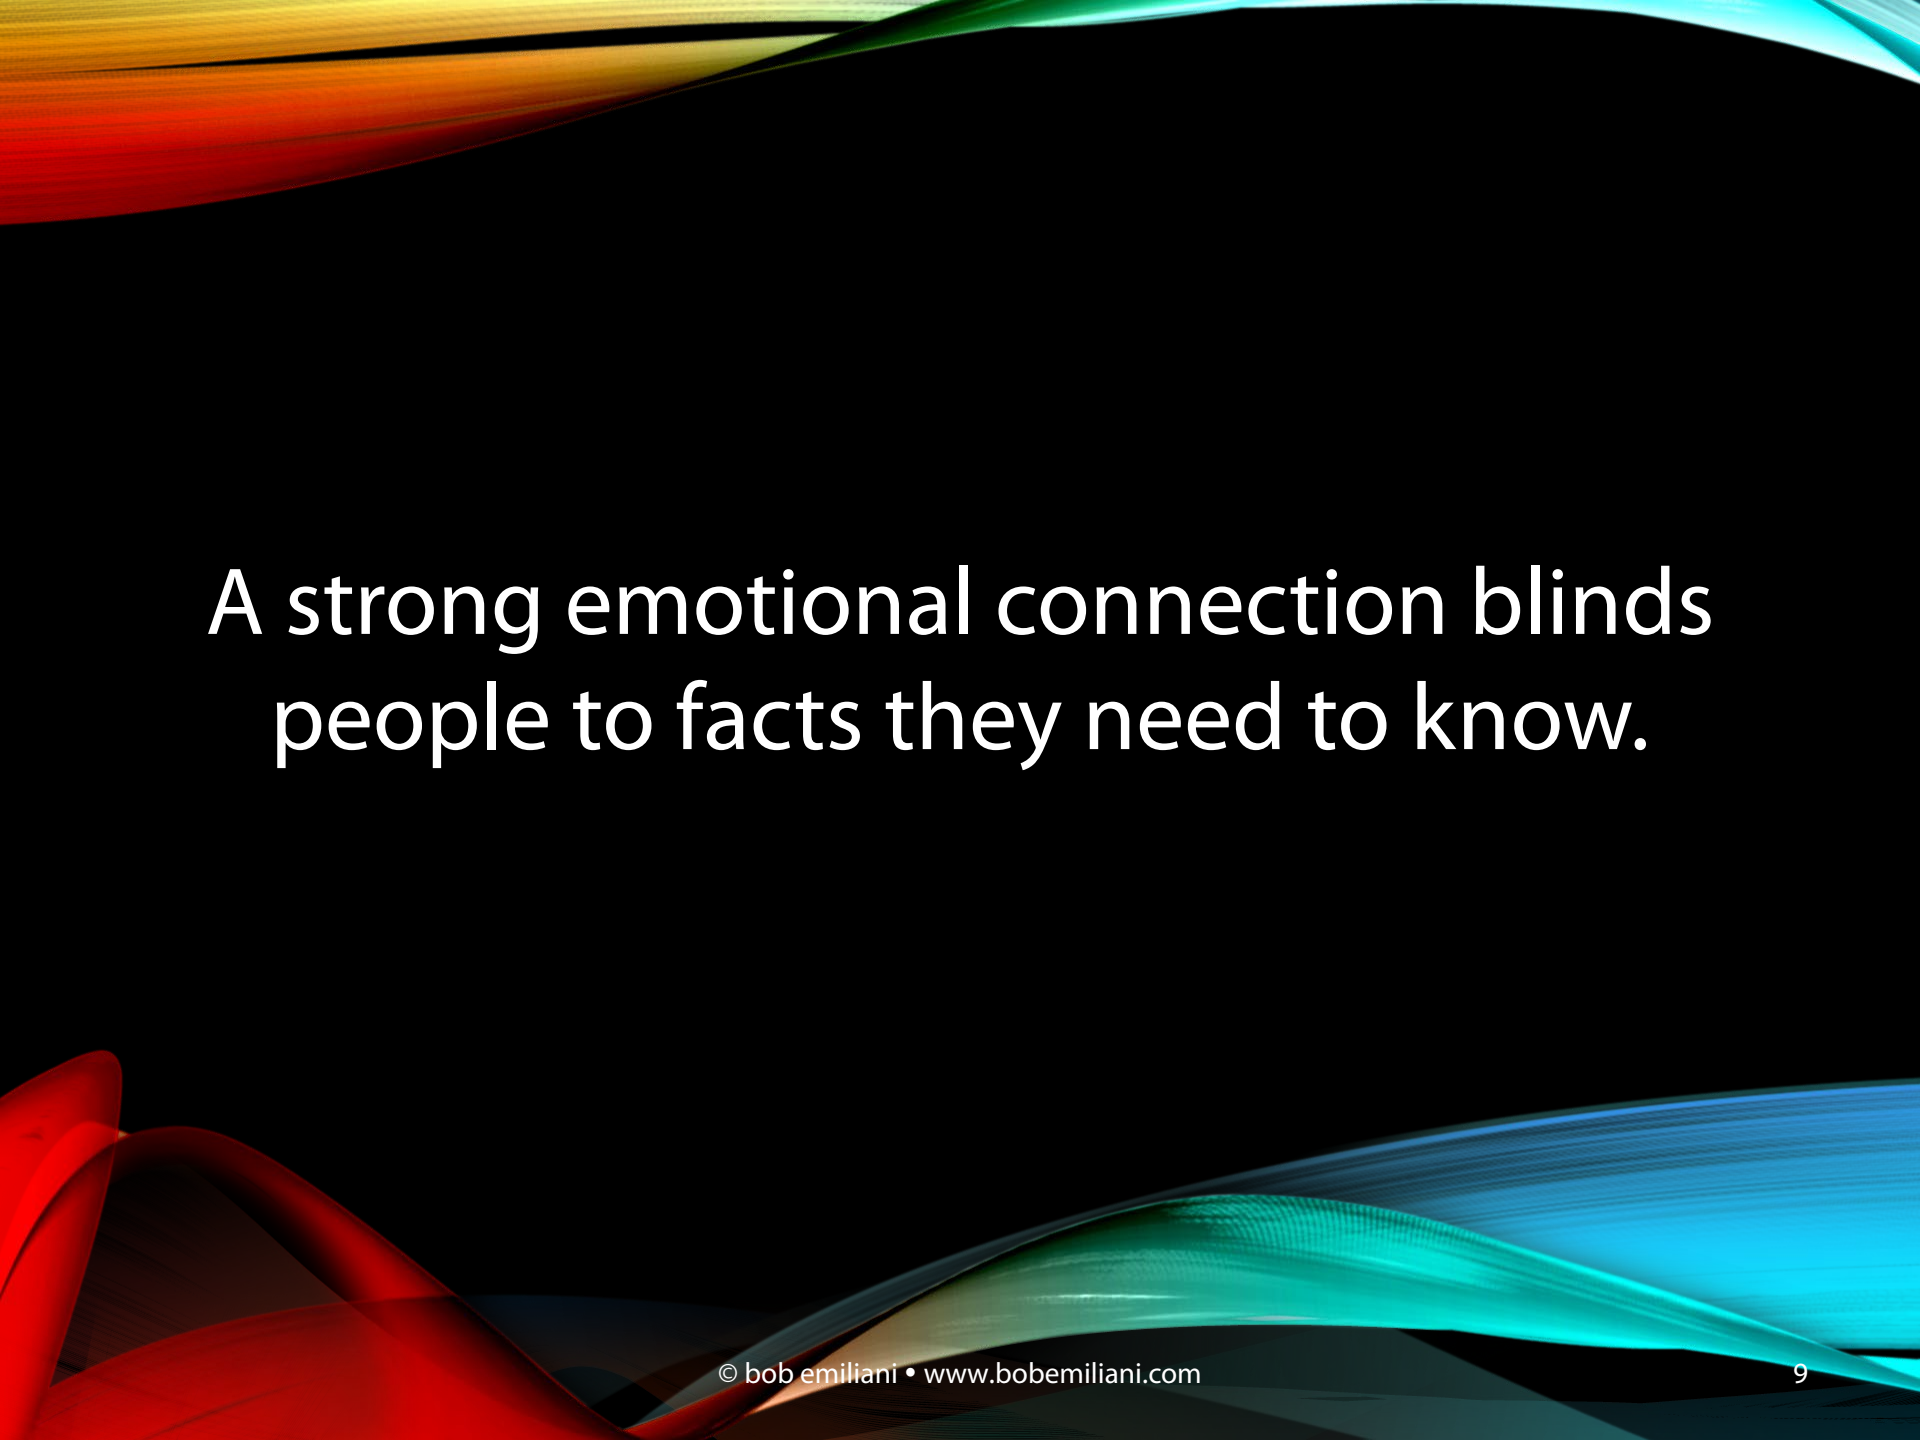

That imparts a feeling of superiority
(which causes different problems).

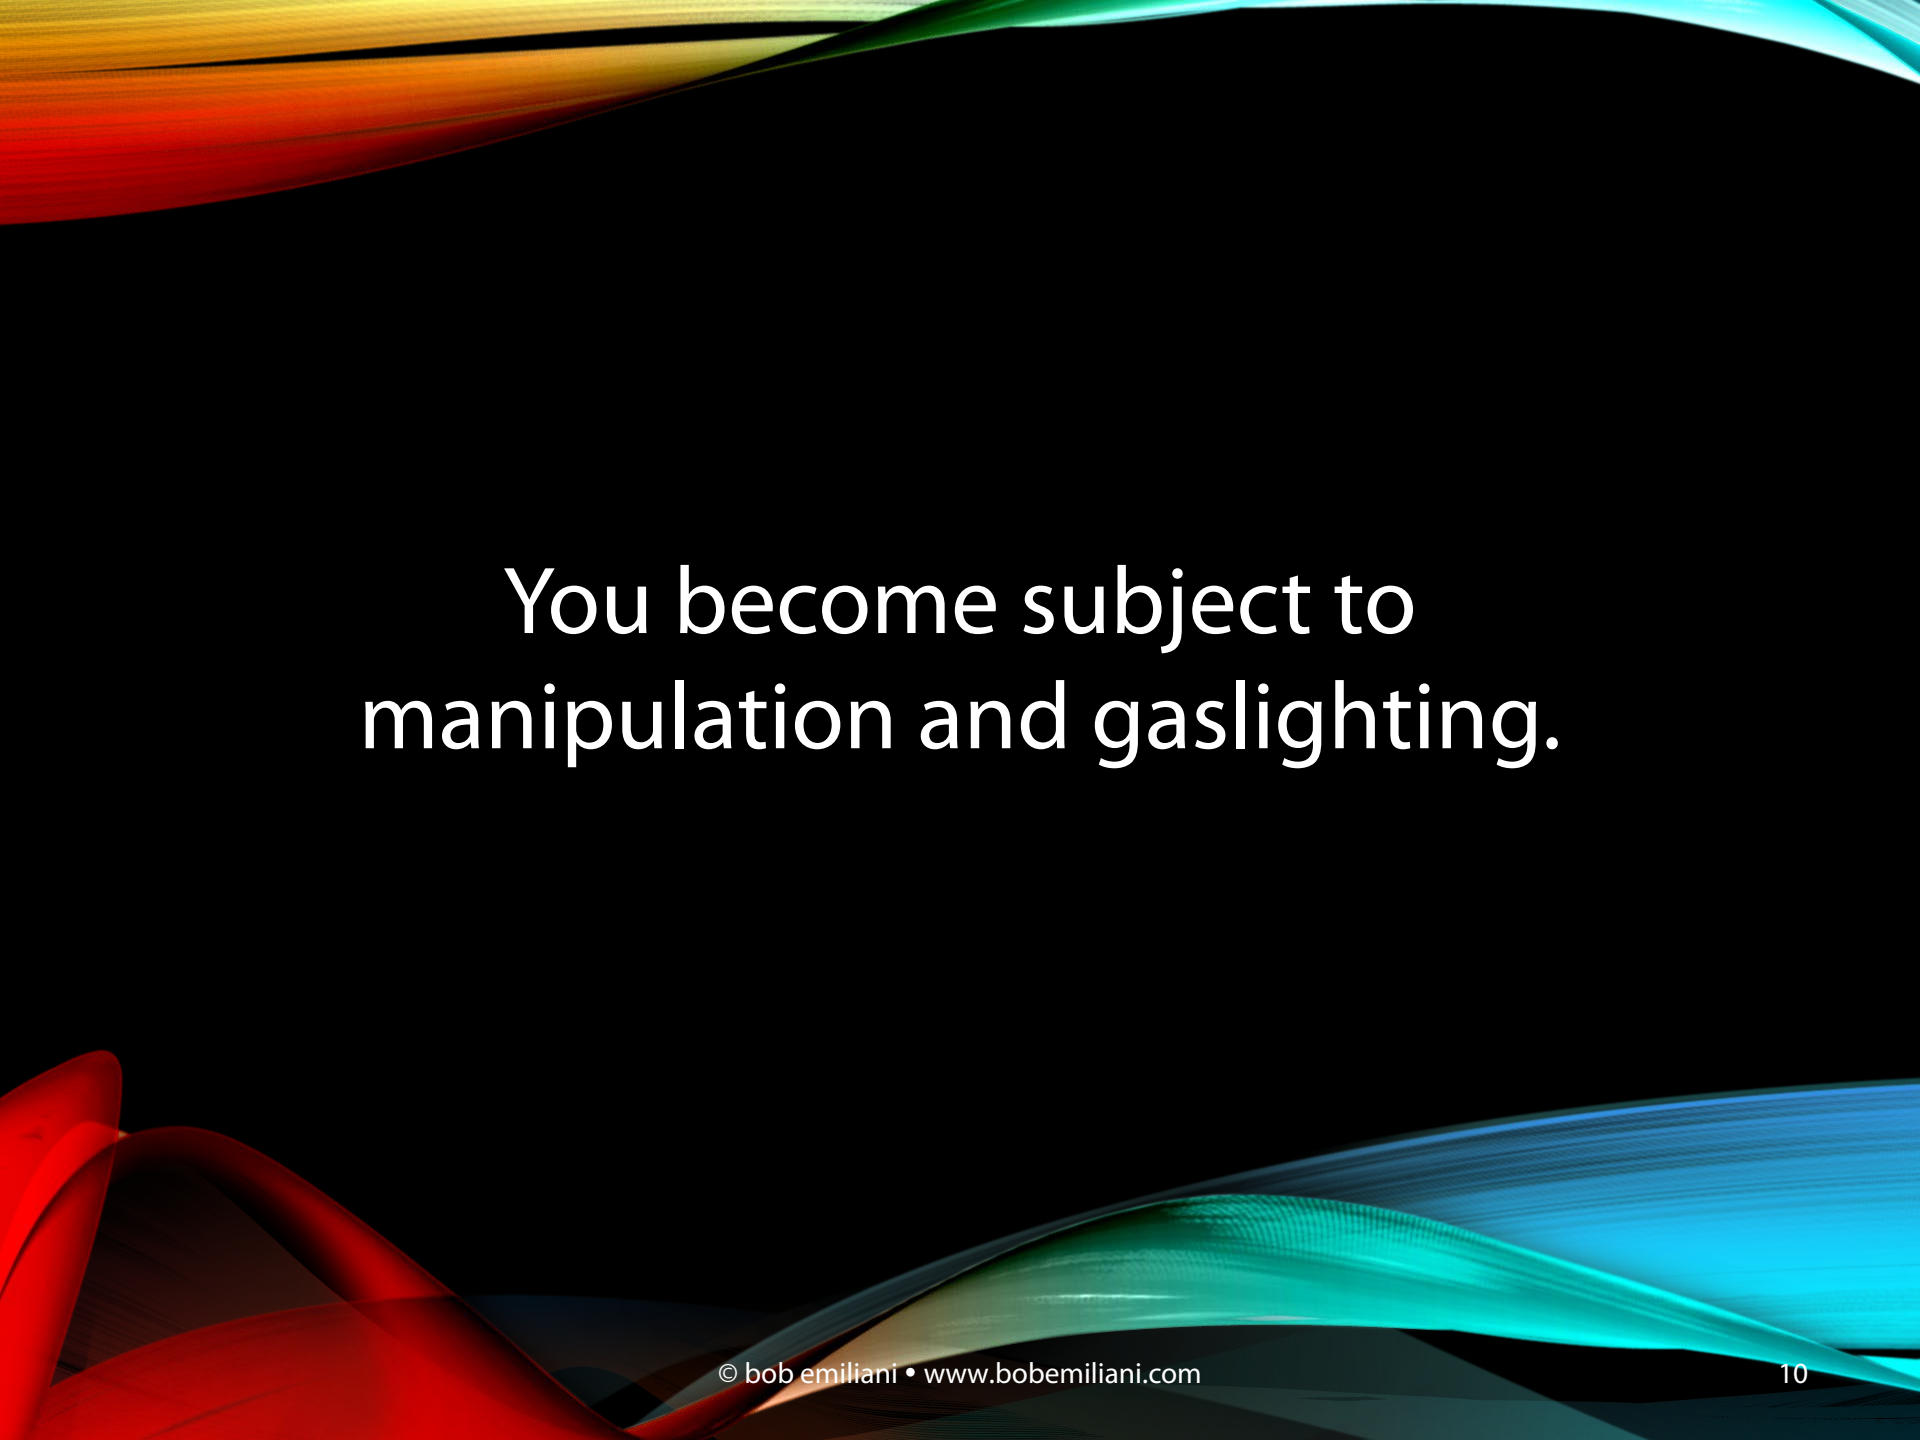

A strong emotional connection is
great for commitment to Lean...

but not very good for improvement.

A strong emotional connection blinds
people to facts they need to know.

You become subject to
manipulation and gaslighting.

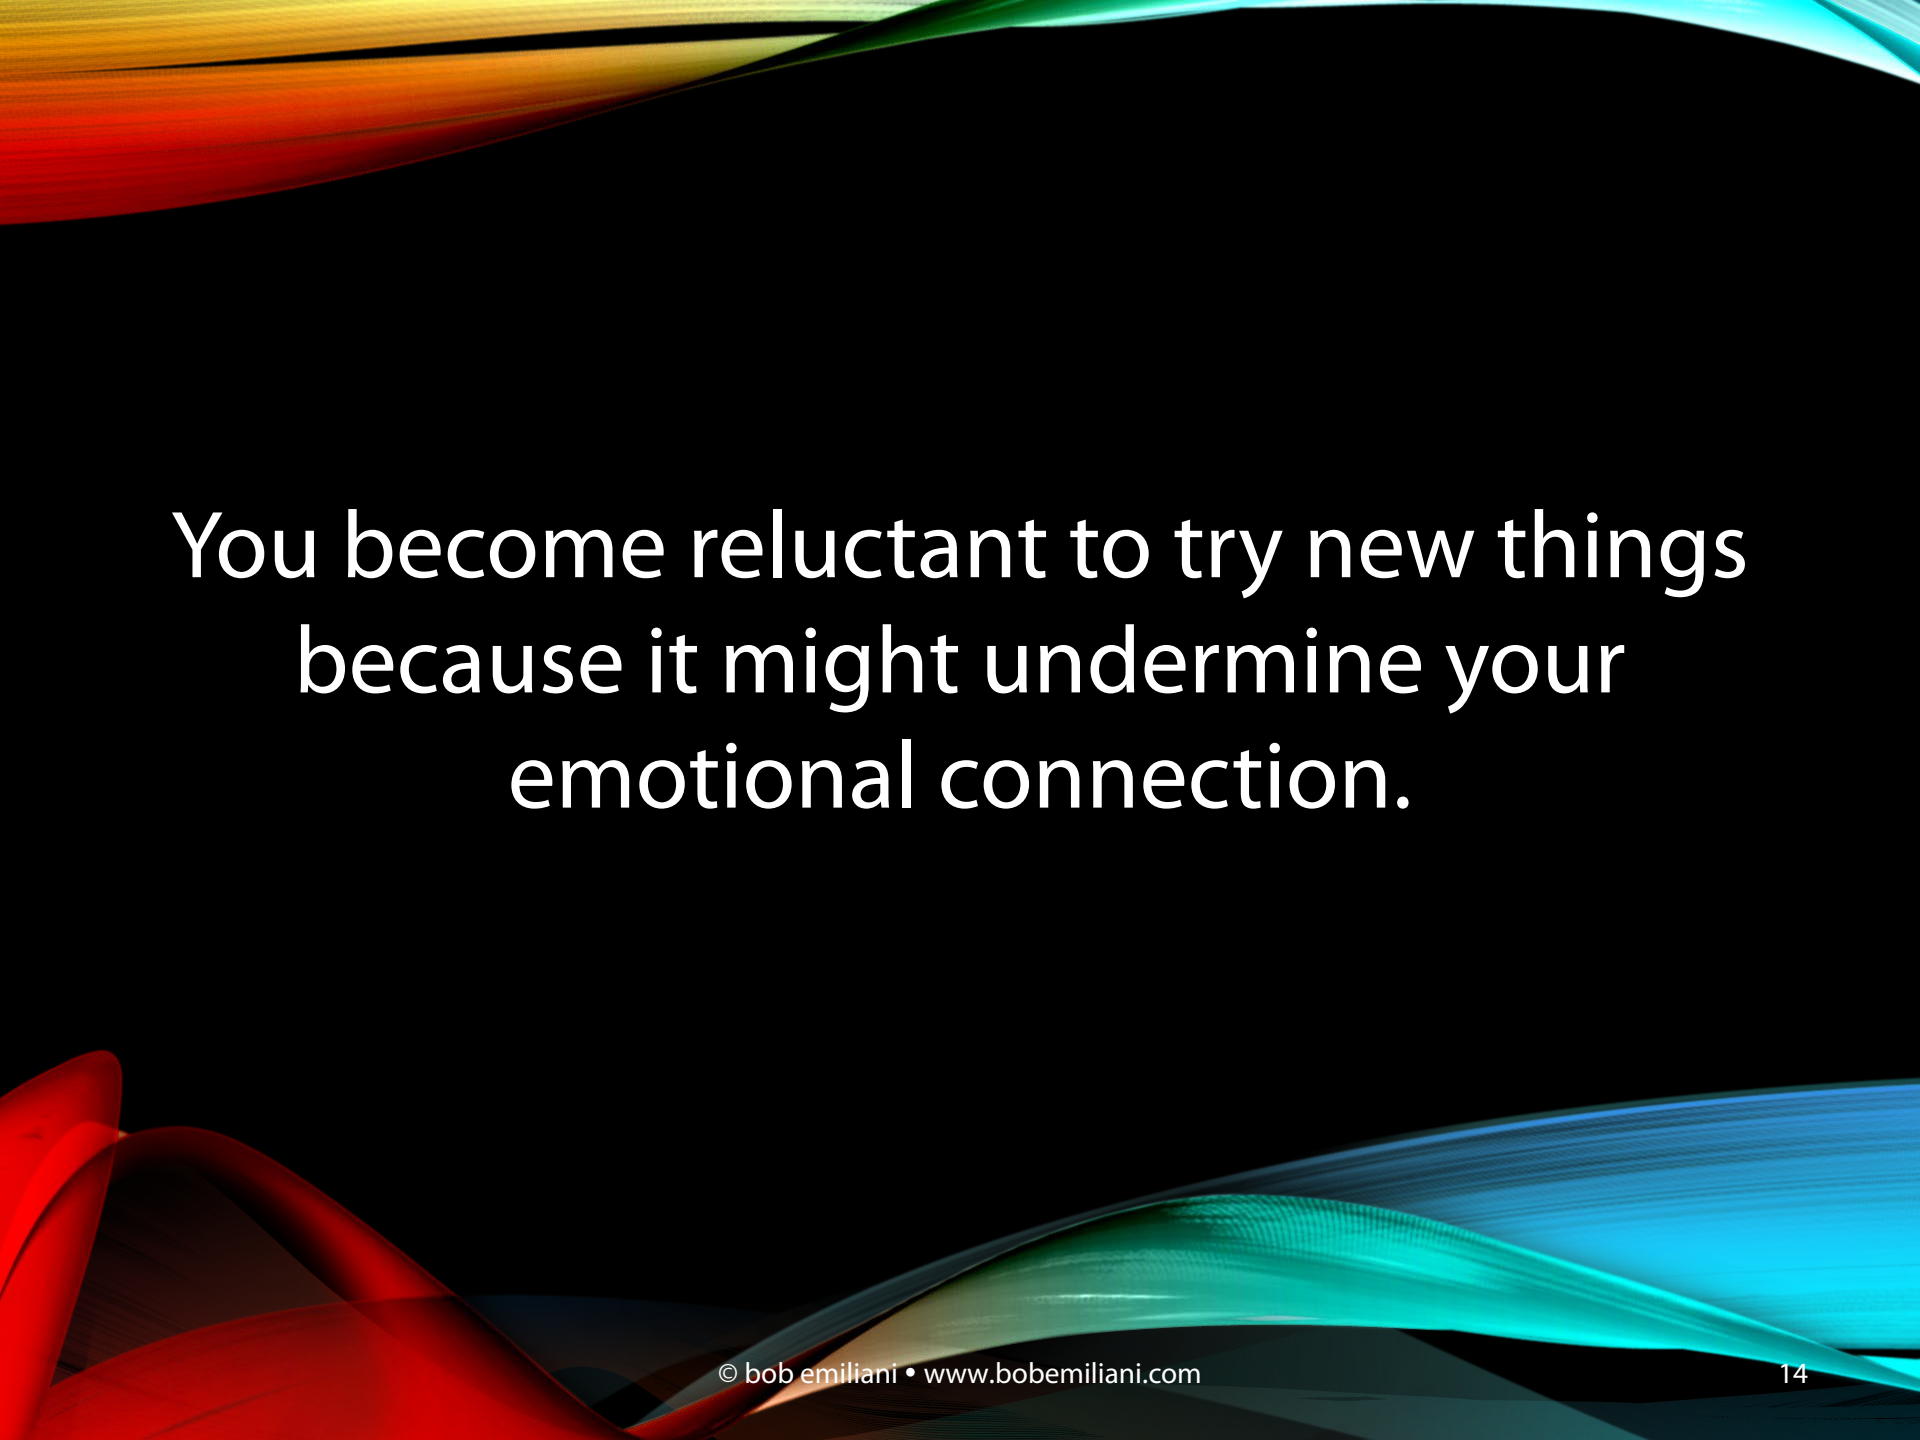

You lose objectivity.

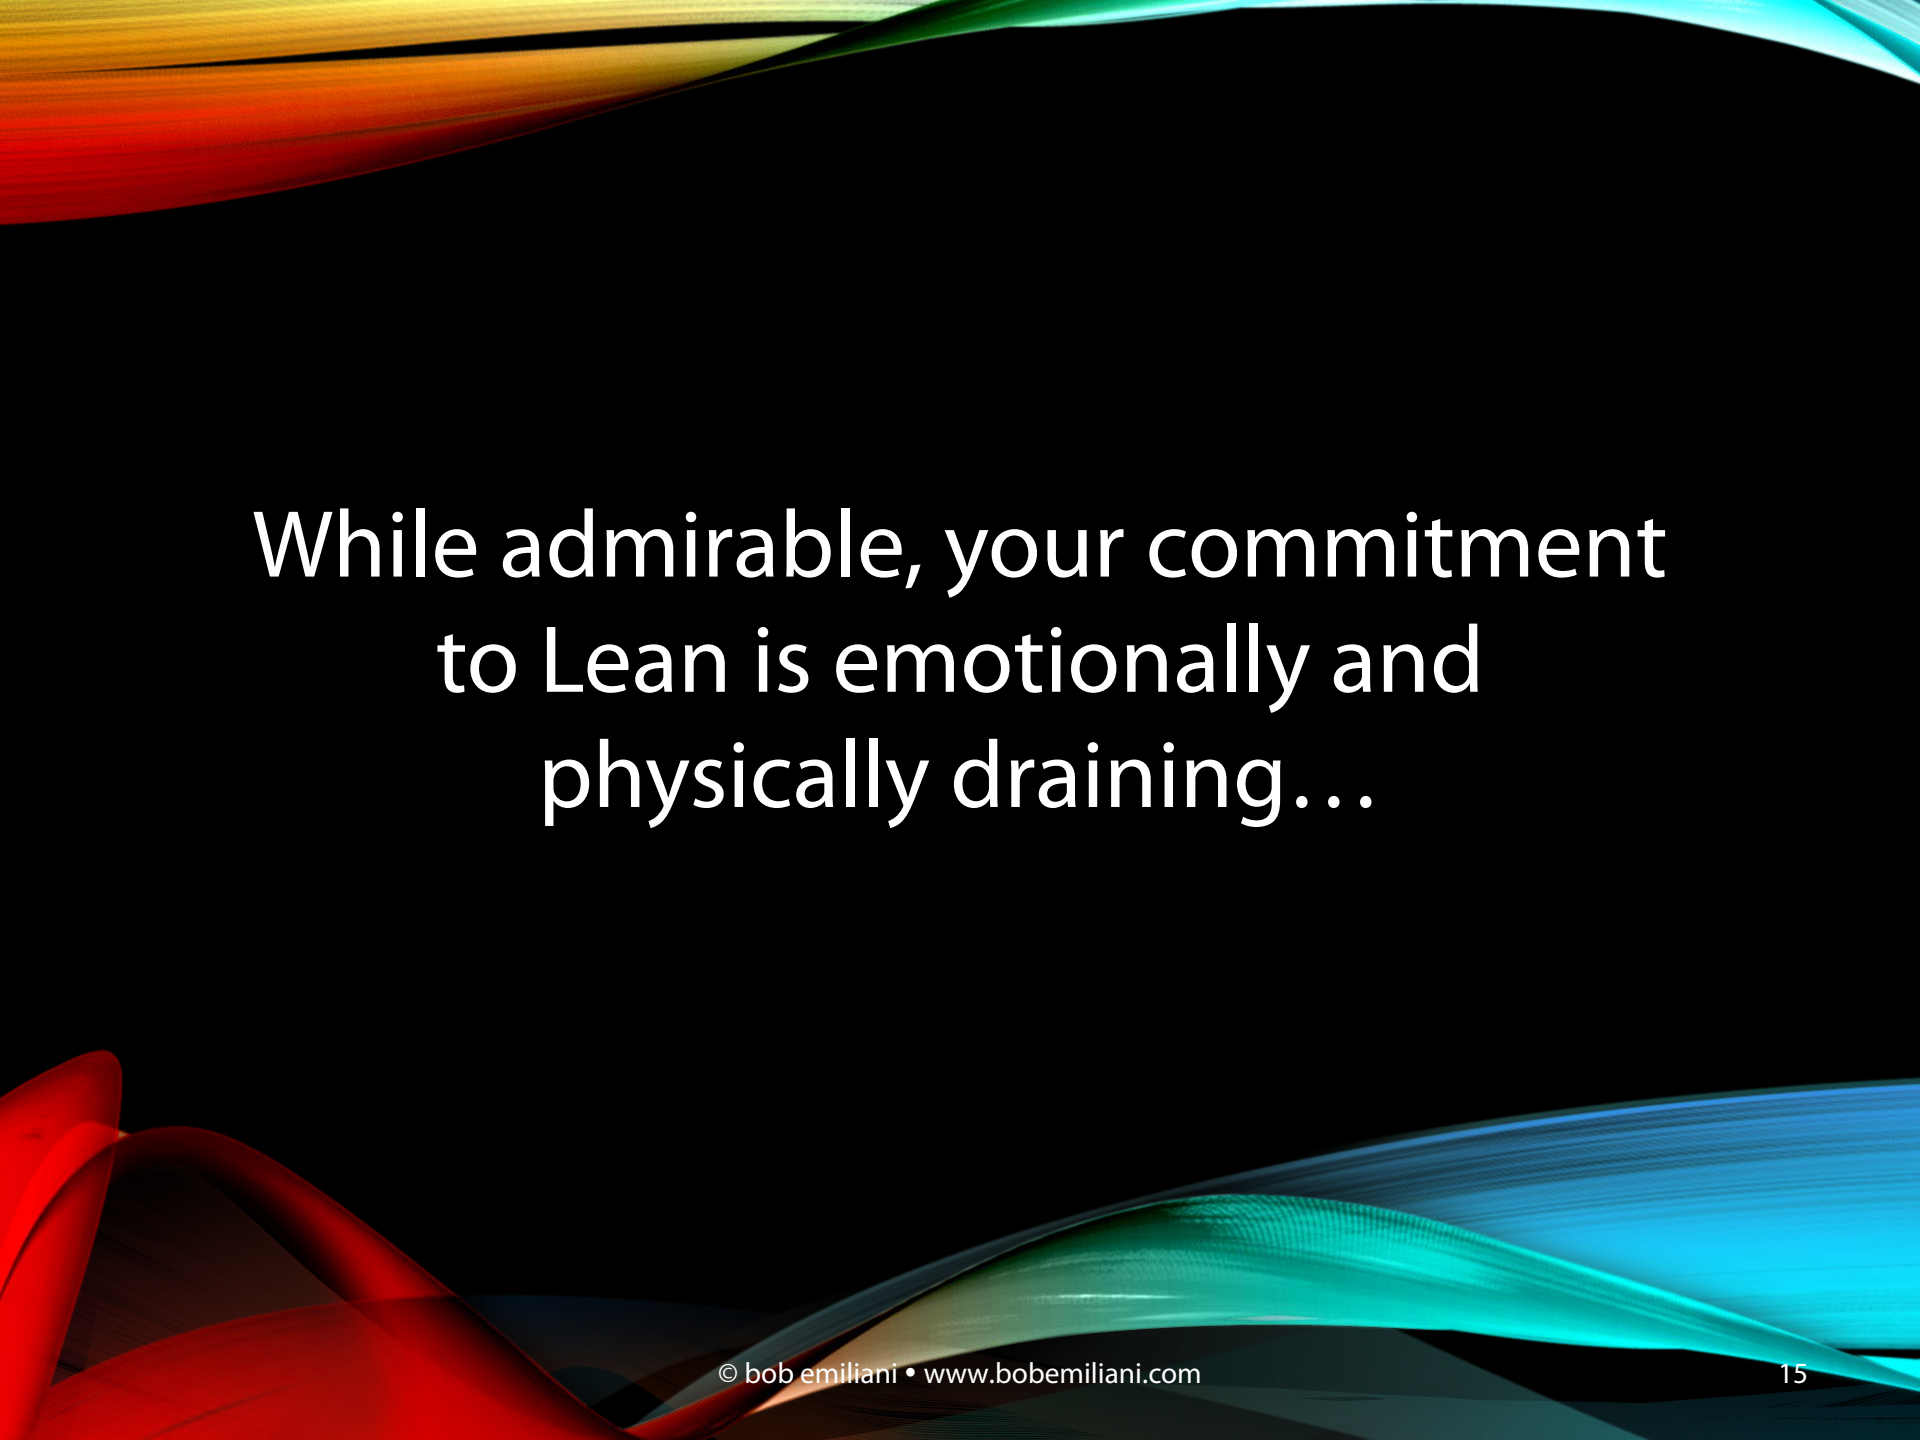

You ignore relevant information...

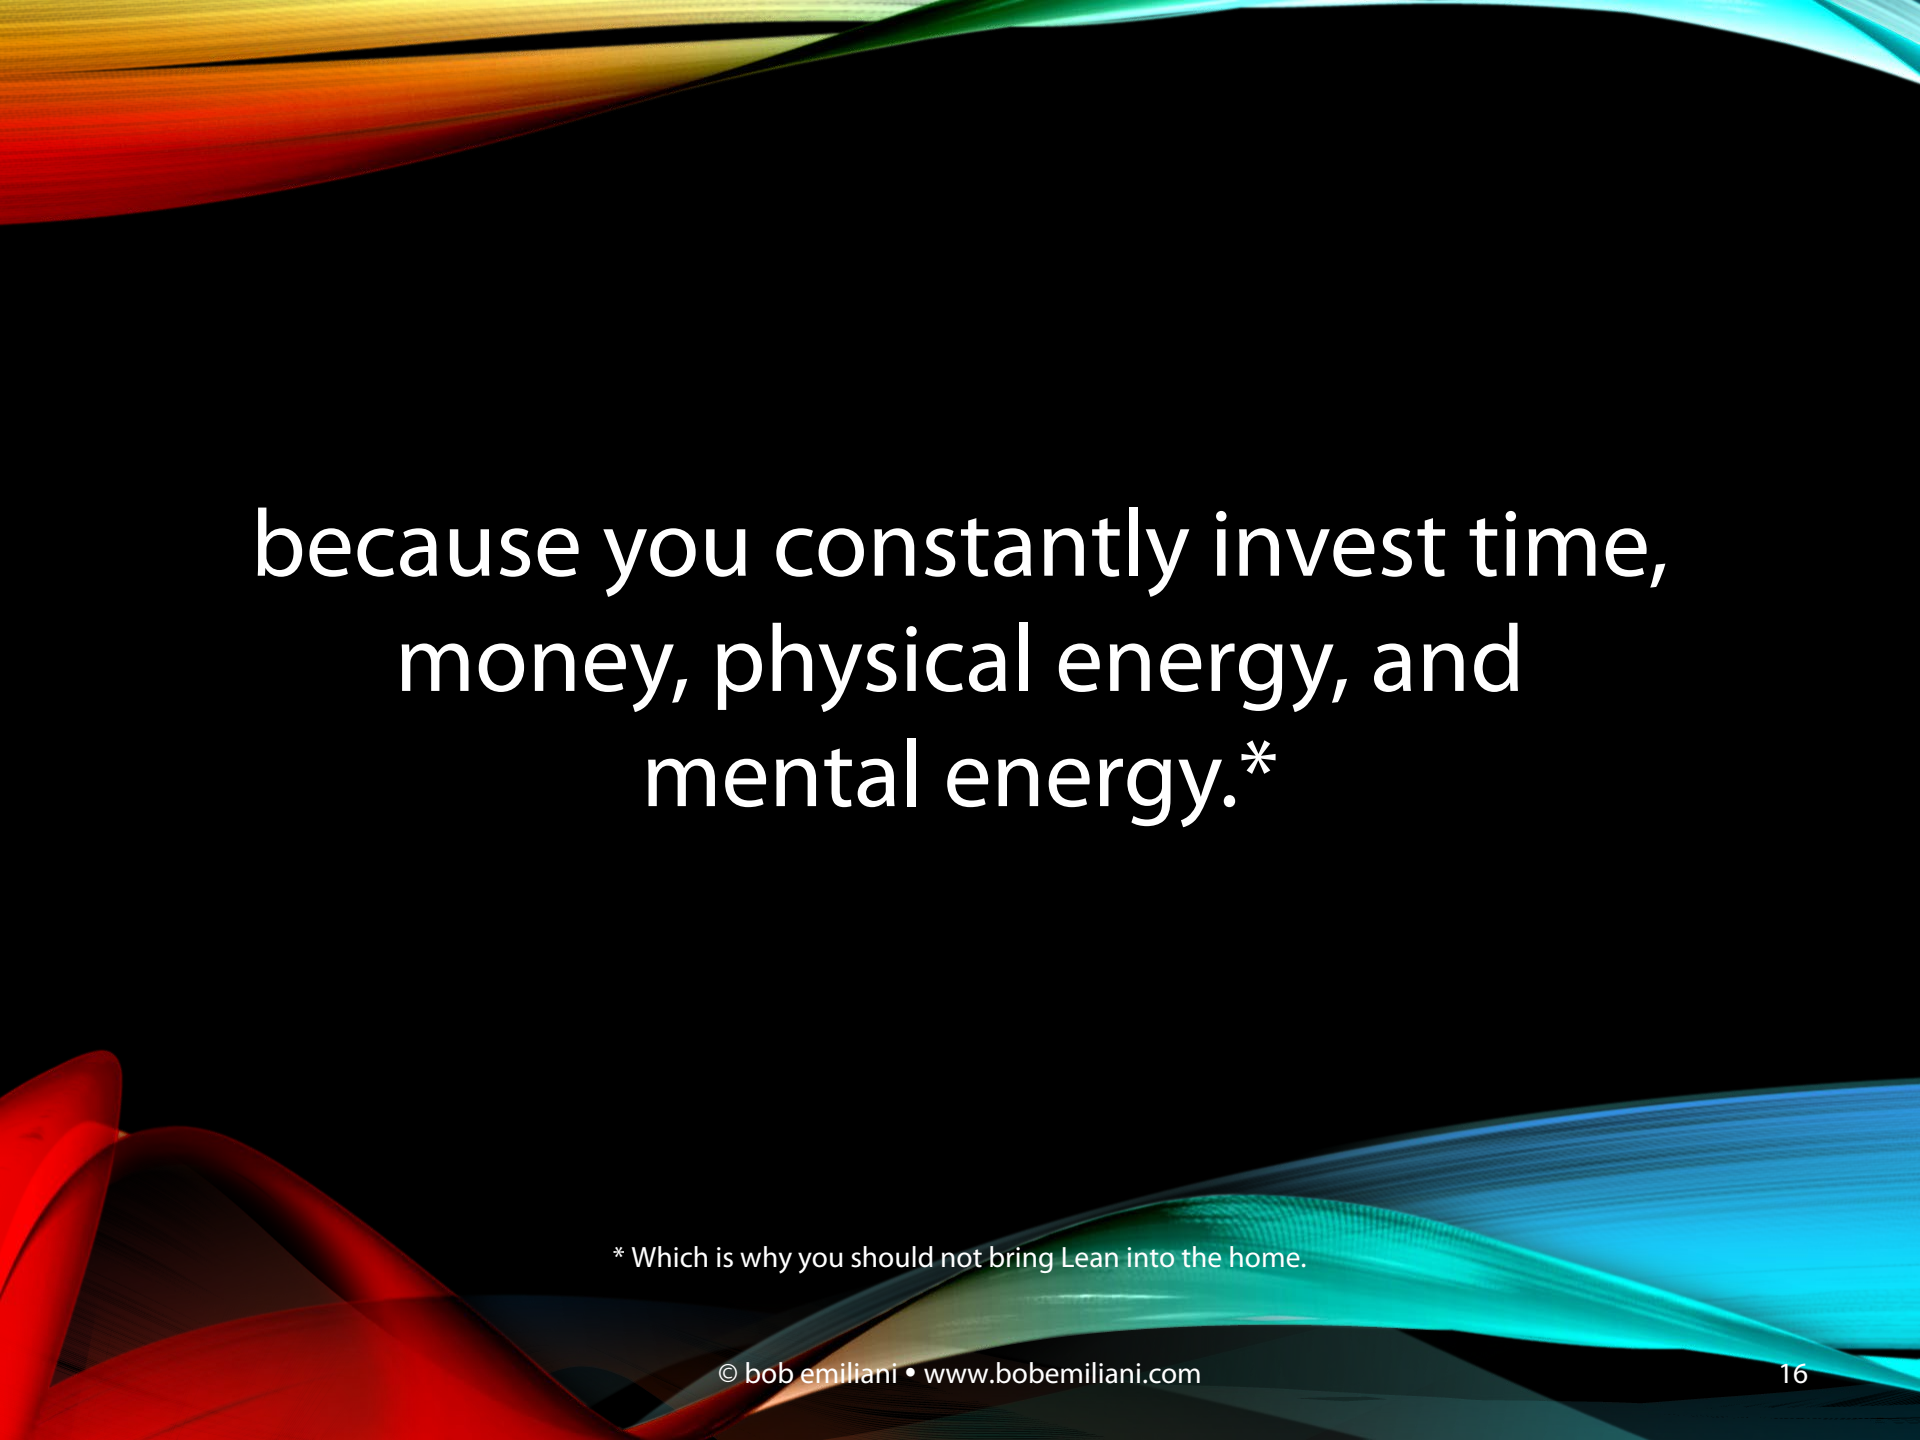

and thus limit your experiences
and opportunities.

You become reluctant to try new things
because it might undermine your
emotional connection.

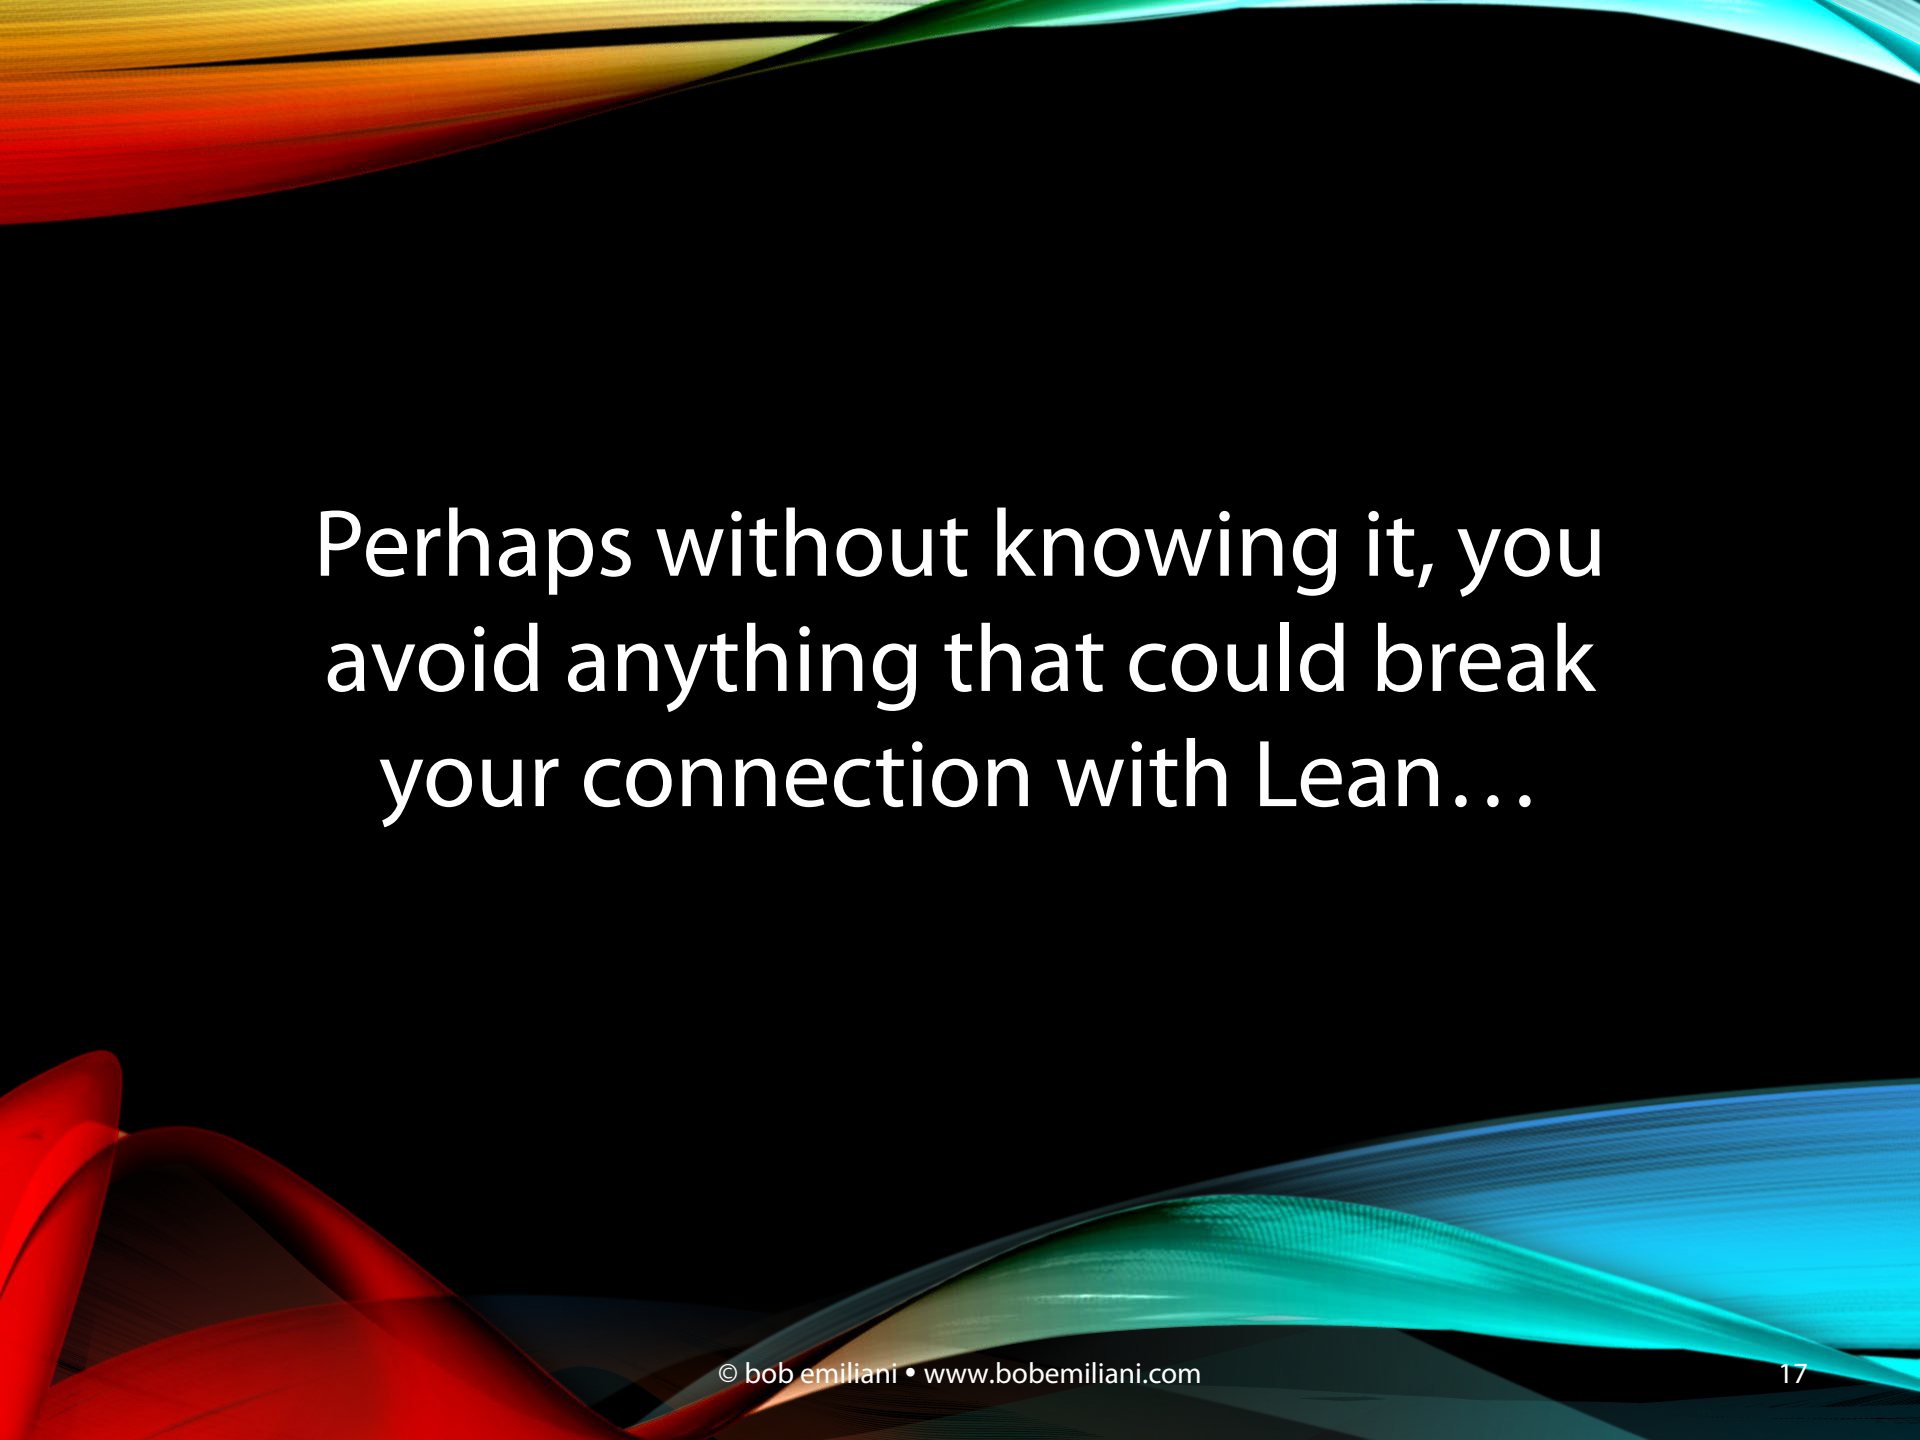

While admirable, your commitment
to Lean is emotionally and
physically draining...

because you constantly invest time,
money, physical energy, and
mental energy.*

* Which is why you should not bring Lean into the home.

Perhaps without knowing it, you
avoid anything that could break
your connection with Lean...

because doing so will be painful.

A strong emotional attachment
to Lean is unhealthy because:

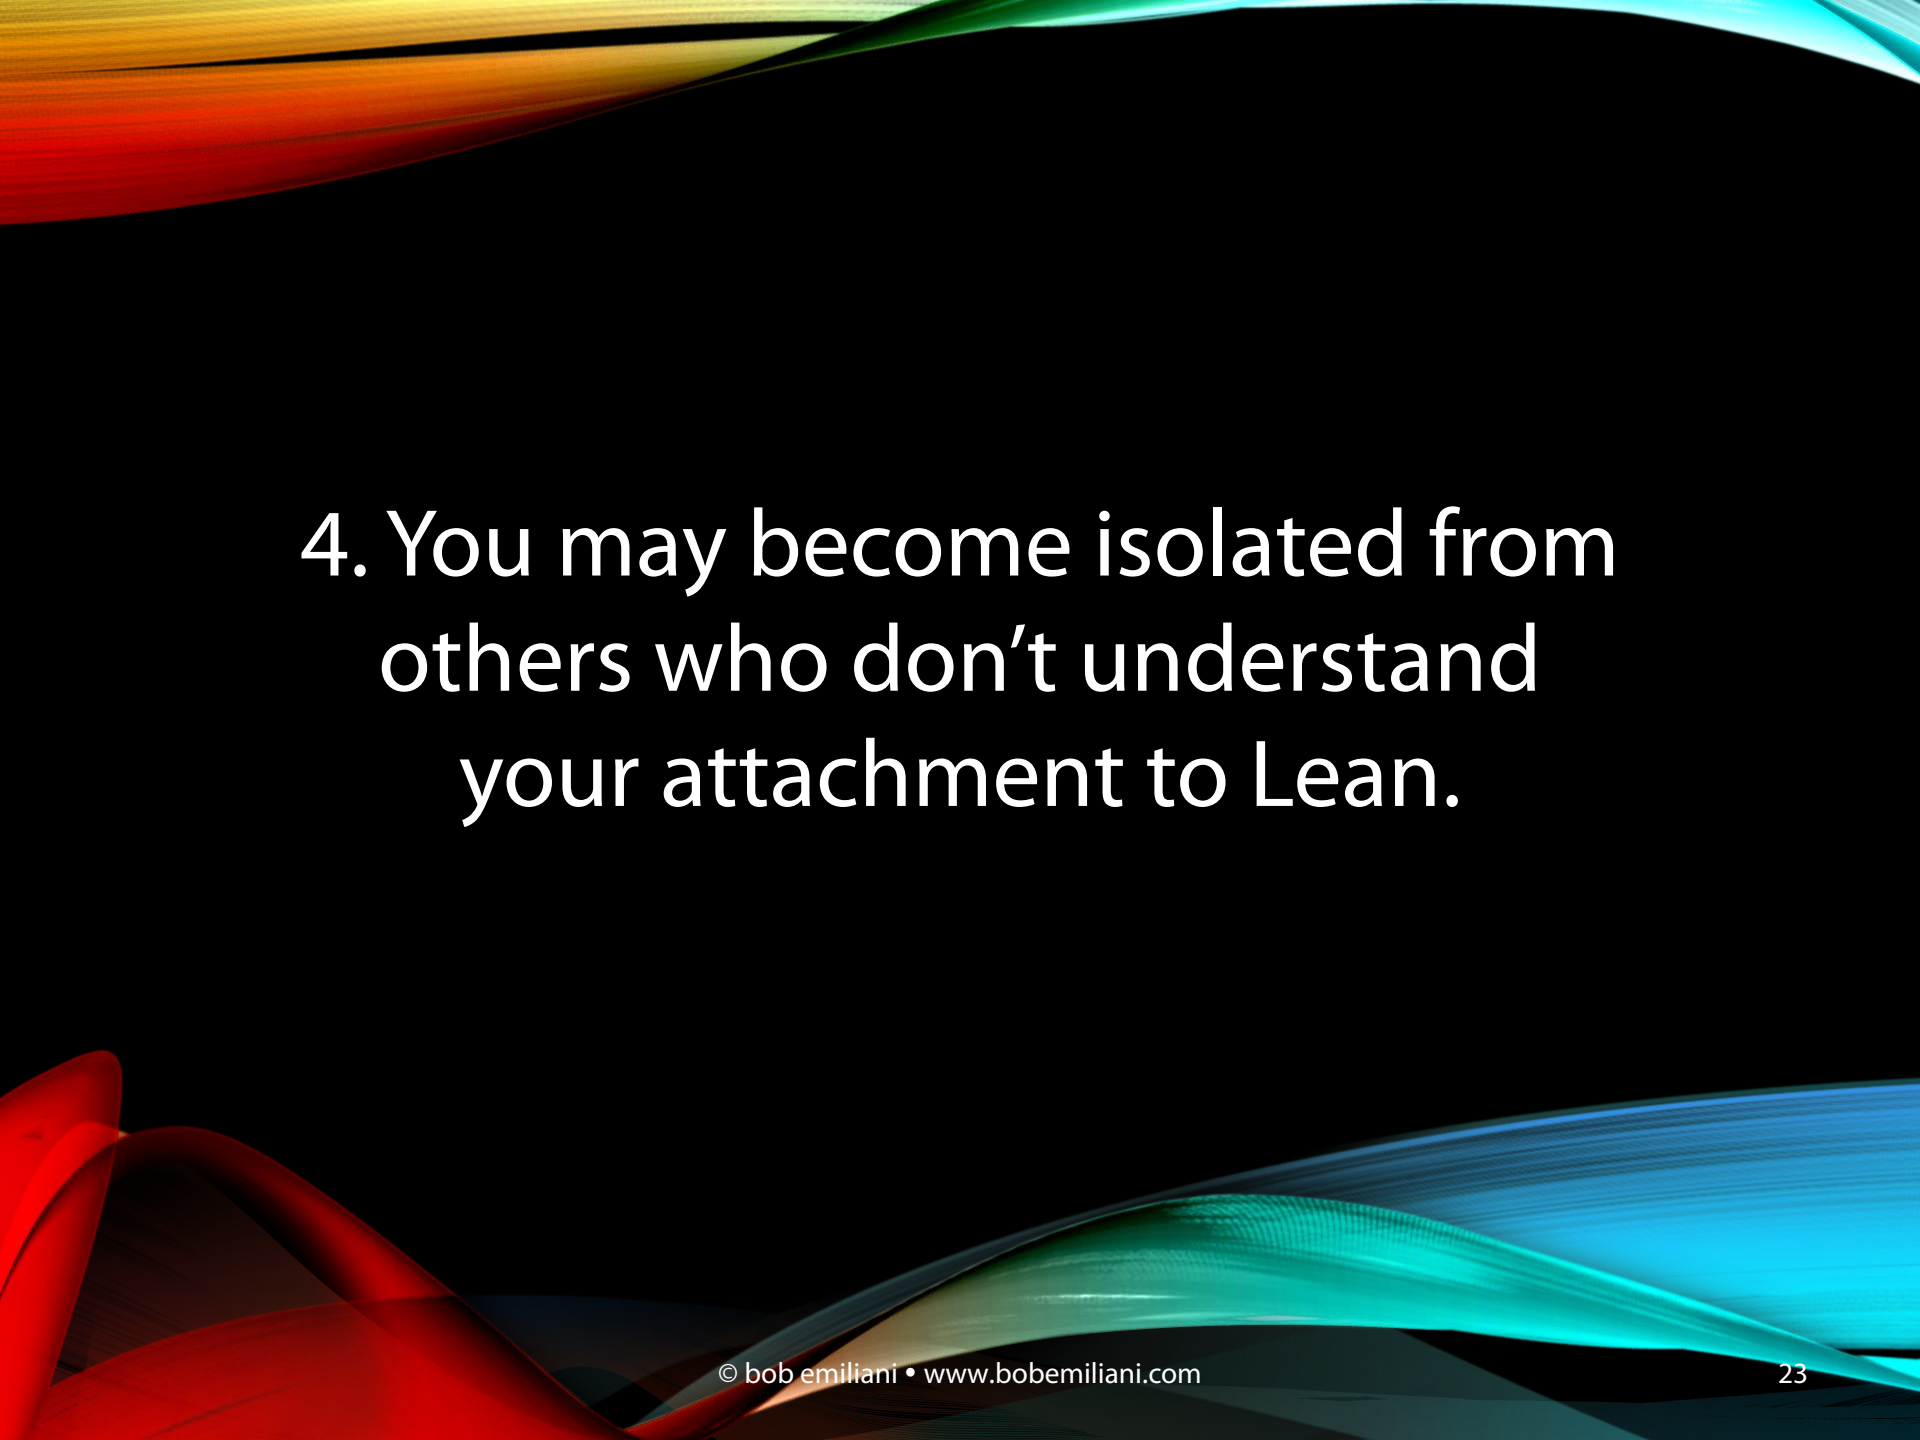

1. You rely on Lean for your sense of self-worth.

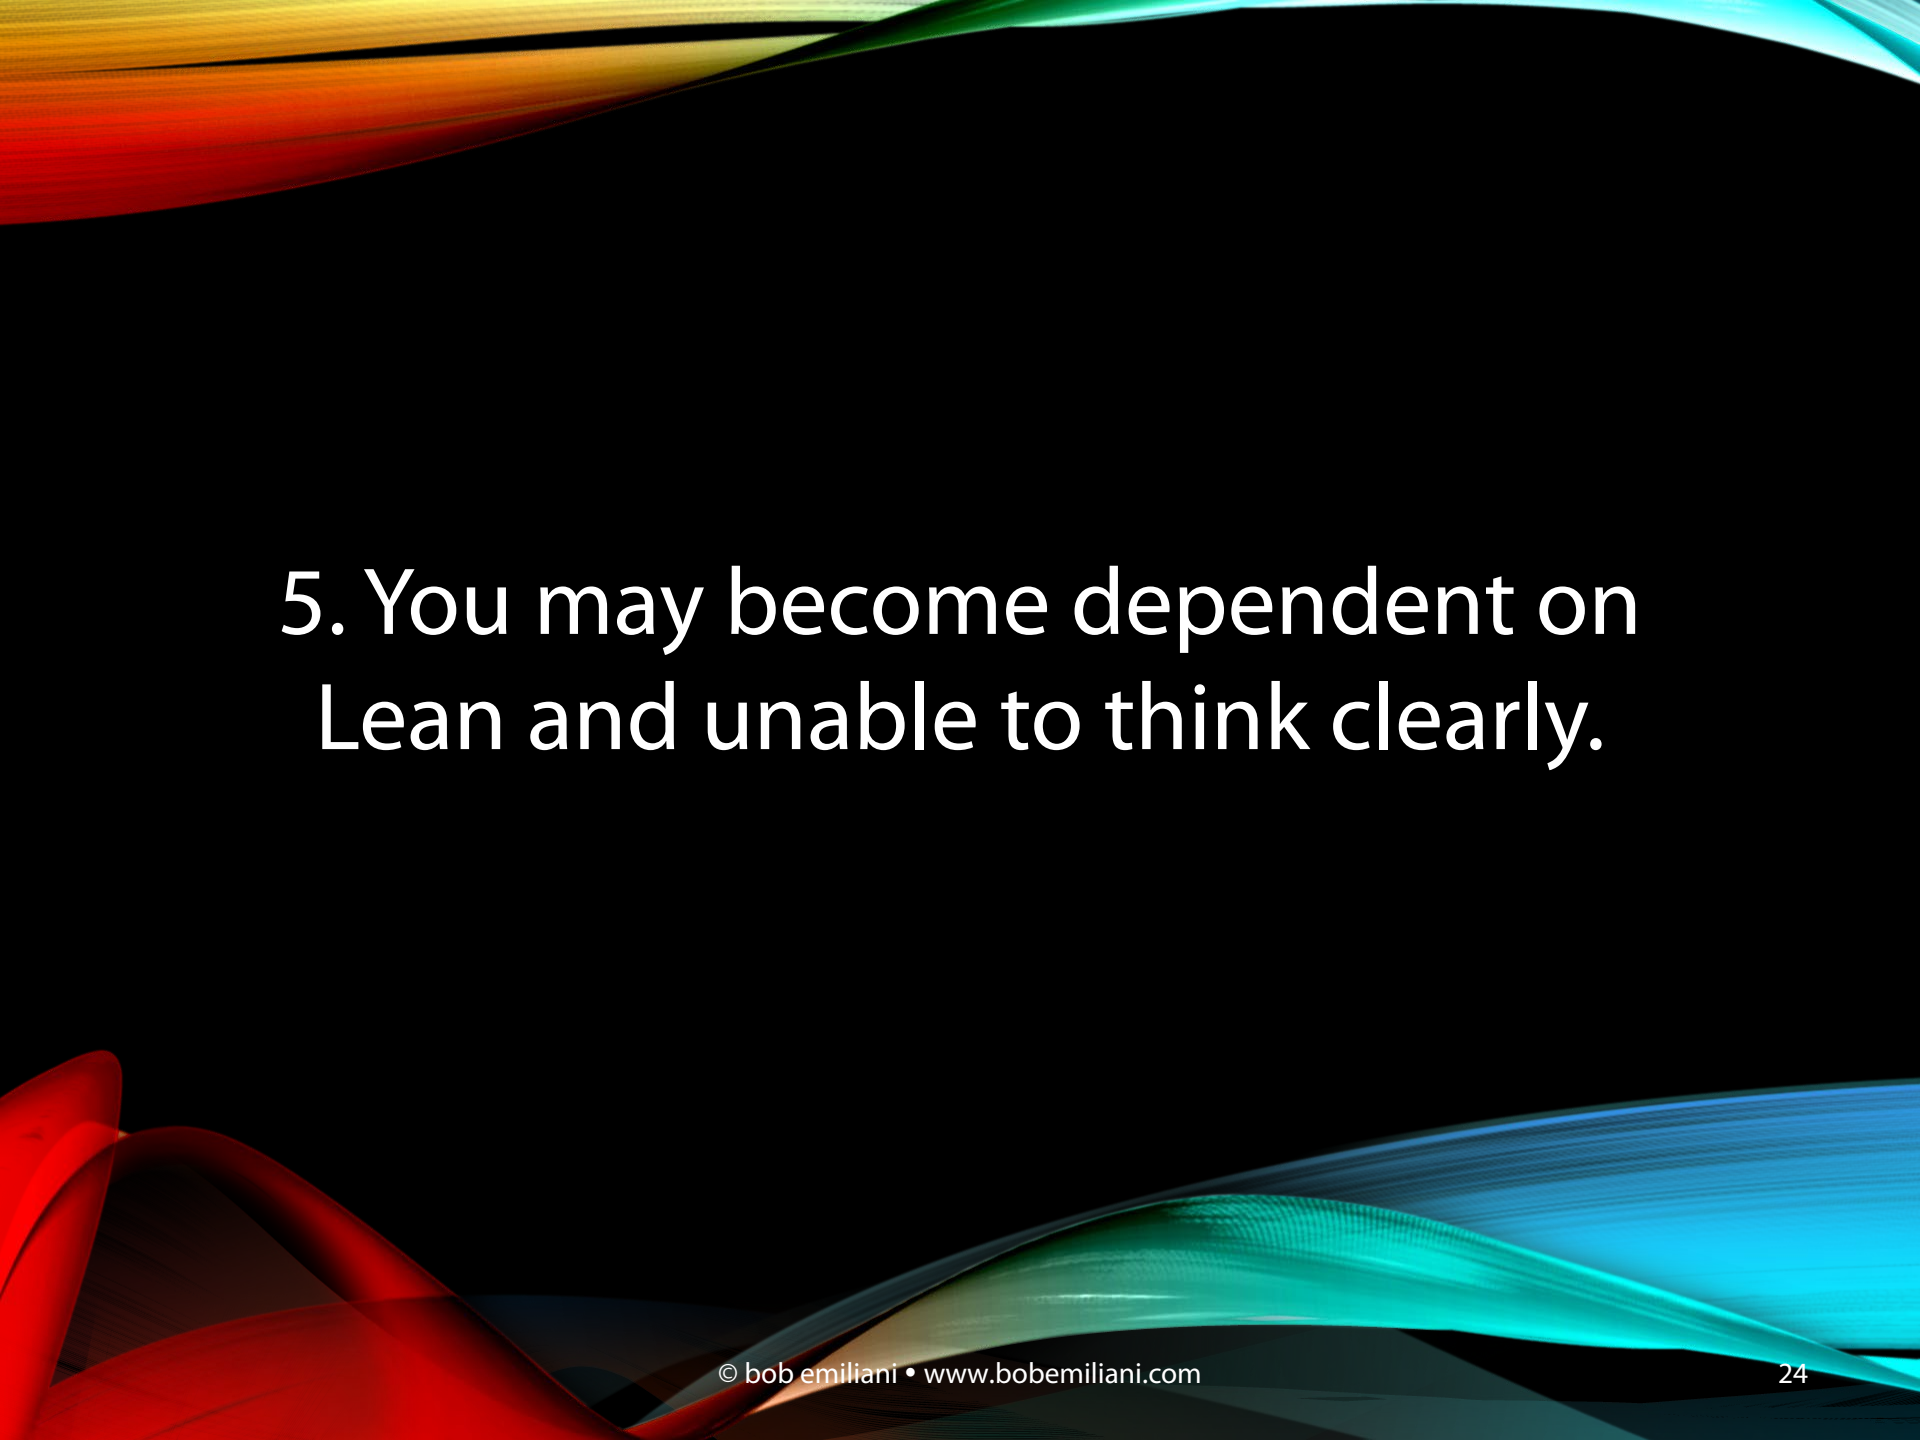

2. You develop a dependency on Lean success stories for your well-being.

3. You may develop anxiety or depression because of Lean.

4. You may become isolated from others who don't understand your attachment to Lean.

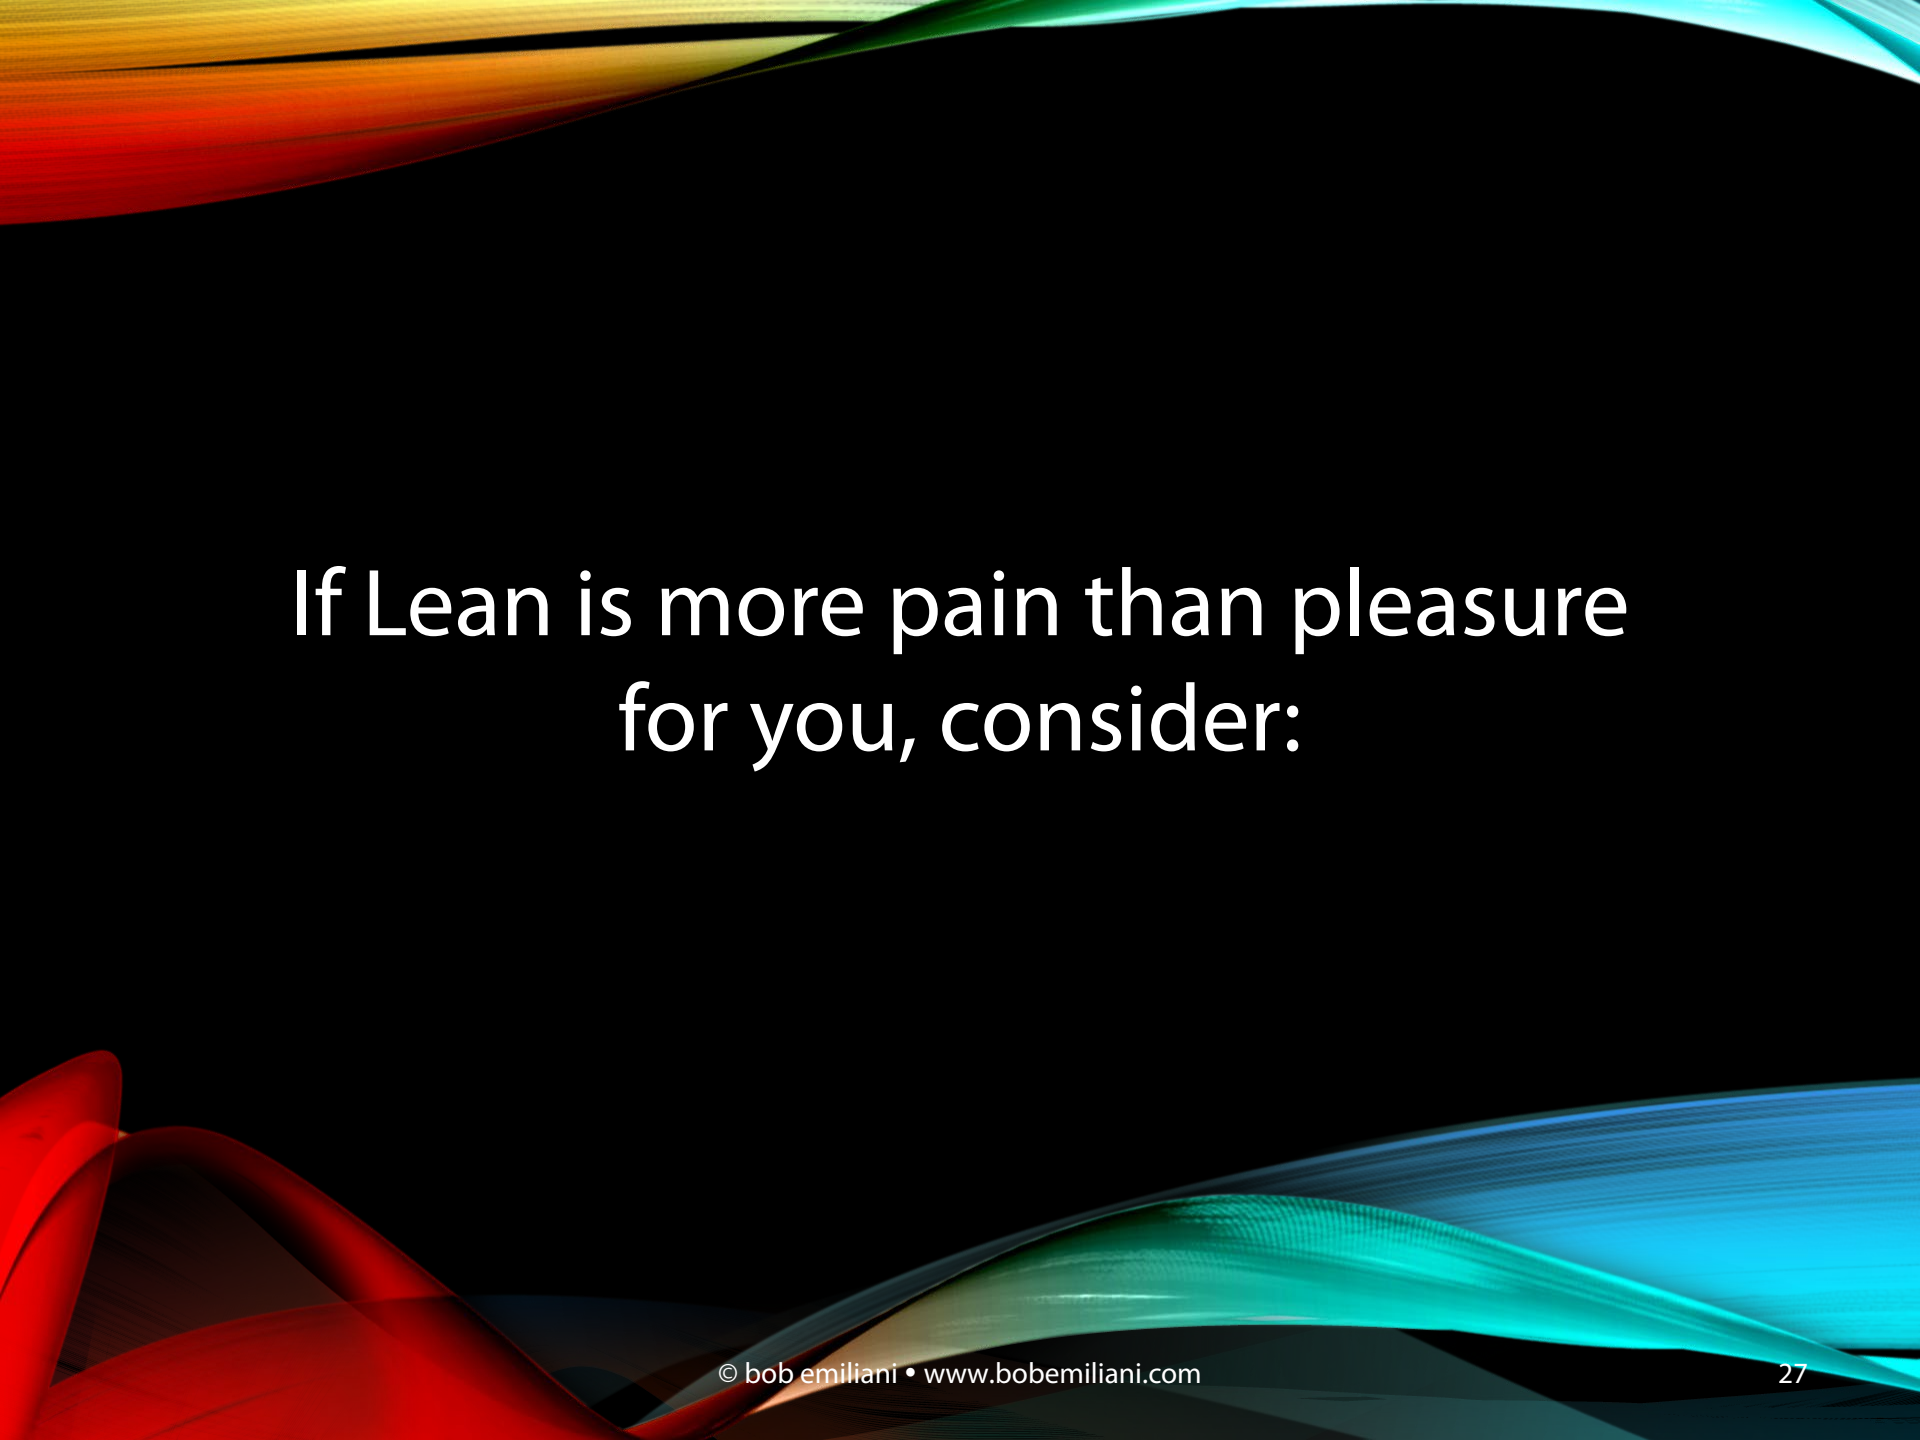

5. You may become dependent on Lean and unable to think clearly.

Mental health in Lean world is
almost never discussed.

It should be.

If Lean is more pain than pleasure
for you, consider:

Becoming more aware of
your needs and limits.

Set boundaries for yourself.

Prioritize your needs over the
needs of Lean.

Seek support.

Or learn from others.*
